DYNA IGNITION BOOSTER
INSTALLATION INSTRUCTIONS

Part No. DBR-1 for engines with single breaker points

The DYNA Ignition Booster was designed for use with stock or aftermarket coils or combinations of coils that have at least THREE OHMS primary resistance.

1) Fasten the clamp to the electronic module using the 4-40 x 5/16 screws and locknuts provided. The clamp and nuts go on the inside of the housing.

2) Attach the module to the frame in the location selected. Cut off excess clamp material.

3) Attach the ground lug (black wire) to a clean ground point. The engine case is recommended, however, a good frame connection can be used if necessary.

4) File the points regardless of their condition, even if new. Leave the condenser connected.

5) Disconnect the points wire from the ignition coil, and connect the blue wire from the booster in it’s place.

6) Connect the white wire from the booster to the breaker points wire removed in the previous step.

7) Connect the red wire from the booster to the coil terminal that has +12 volts applied to it when the ignition switch is turned on.
